

core180 Capacity Distribution

Wholesale Bandwidth Partitioning

Core180's Capacity Distribution service provides the ability to reduce costs through wholesale purchasing power and enables expansion of your telecommunication footprint without additional capital expense or operational challenges.

The solution works by utilizing hubs located at Core180 POPs to partition bulk capacity (e.g. OC-3, OC-12, OC-48) and deliver it to endpoints in smaller increments such as T-1 or DS-3. Capacity can be distributed locally, regionally or nationally in any combination of speeds and leverages the efficiency of the Core180 network for long haul transport.

Since Core180 operates and manages its backbone network, provisioning is rapid and can generally be measured in days vs. weeks or months for typical carrier products.

The Capacity Distribution service also provides direct access into Tier 1, 2 and 3 markets, enabling you to expand your presence in a cost effective and logical manner.

For organizations desiring to aggregate and distribute capacity, the offering provides flexibility and economies of scale in a carrier agnostic setting.

core180 Advantages

Cost Effective - Significant savings from purchasing wholesale capacity and leveraging the Core180 platform to efficiently partition it into smaller circuits

Private - Secure and guaranteed long haul transport on Core180's backbone network

Easy Integration - Ties directly into the Core180 platform, enabling interconnection to all area network providers

Improved Visibility - Provides enhanced circuit visibility and management capabilities

core180 Operational Flexibility

Efficient - Once the customer trunk is configured and tested, it is faster and easier to tie in additional circuits

Reduced OPEX - Alleviates the headaches of managing additional providers and equipment

Fully Managed - Reduces administrative expenses

Enhanced Support - Provides complete resolution with just one call
